

## RX Family

### Graphic LCD Controller Module Using Firmware Integration Technology

---

#### Introduction

This application note describes the graphic LCD controller module using firmware integration technology (FIT). This module uses the graphic LCD controller (GLCDC) to display image data on the liquid crystal display (LCD) panel.

This module is hereinafter referred to as GLCDC FIT module.

#### Target Devices

The following is a list of devices that are currently supported by this API:

- RX65N, RX651 Groups, ROM capacity: 1.5 MB to 2 MB
- RX72M Group

When using this application note with other Renesas MCUs, careful evaluation is recommended after making modifications to comply with the alternate MCU.

#### Target Compilers

- Renesas Electronics C/C++ Compiler Package for RX Family
- GCC for Renesas RX
- IAR C/C++ Compiler for Renesas RX

For details of the confirmed operation contents of each compiler, refer to 6.1 Operation Confirmation Environment.

## 1. Overview

### 1.1 GLCDC FIT Module

The GLCDC FIT module can be used by implementing it to the project. For implementing the GLCDC FIT module, refer to 2.12 Adding FIT Module to Your Project.

### 1.2 Overview of the GLCDC FIT Module

The GLCDC FIT module uses the GLCDC to provide the method to output image data read from memory to the LCD panel.

The GLCDC FIT module supports the following features:

- 32- or 16-bit per pixel image data and 8-, 4-, or 1-bit CLUT (color lookup table) data format
- Superimposition of three planes (and alpha blending of two planes)
- Correction of brightness, contrast, and RGB gamma for the LCD panel to output image data
- Parallel data output of RGB888, RGB666, and RGB565. Dithering for the output data format.

### 1.3 Summary of the API

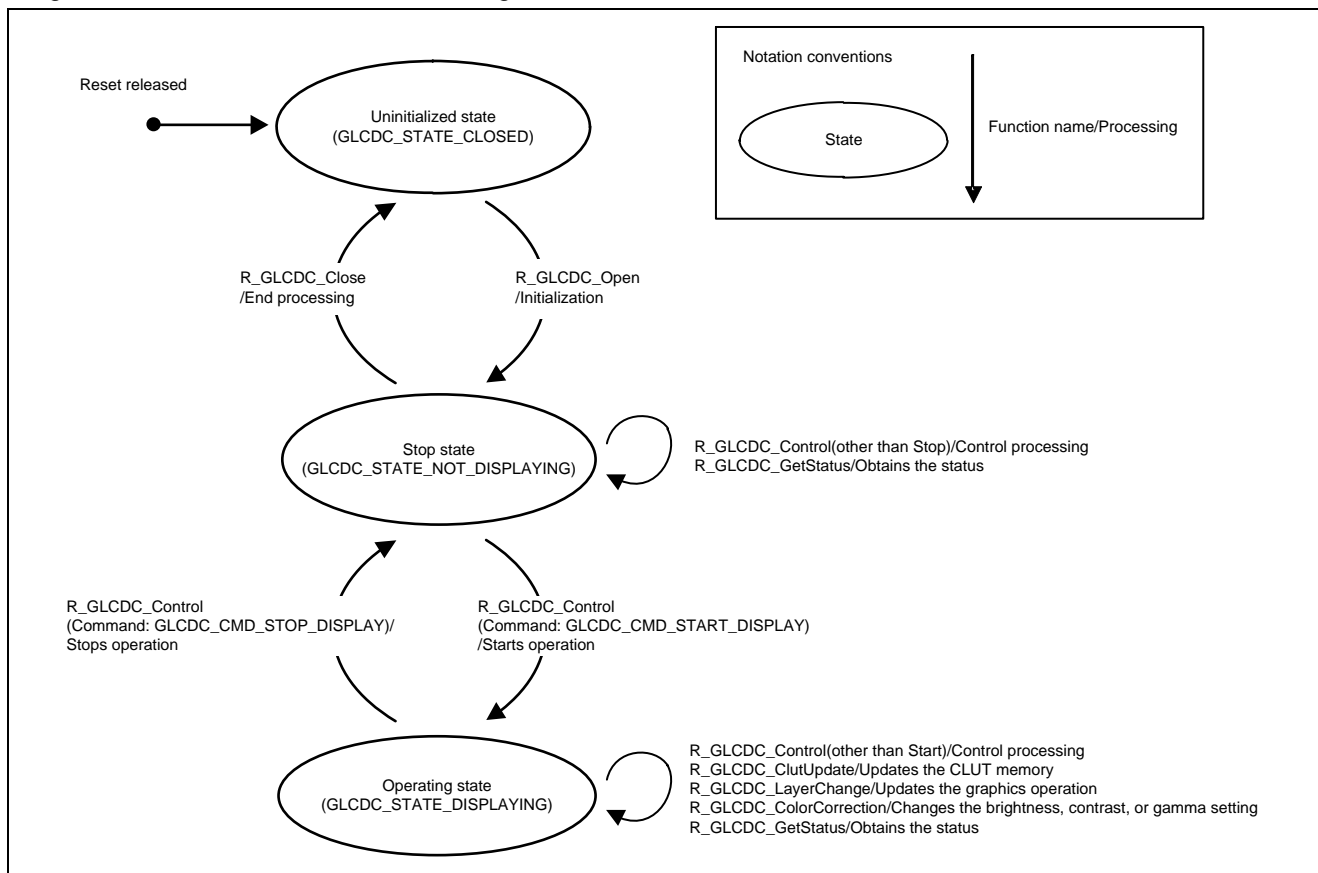

Table 1.1 lists API functions included in the GLCDC FIT module:

**Table 1.1 API Functions**

Function	Description
R_GLCDC_Open	Initializes the GLCDC FIT module.
R_GLCDC_Close	Closes the GLCDC FIT module.
R_GLCDC_Control	Performs control processing for the GLCDC FIT module.
R_GLCDC_LayerChange	Changes operation of graphics 1 and graphics 2 of the GLCDC.
R_GLCDC_ColorCorrection	Changes settings for brightness, contrast, and gamma correction of the GLCDC.
R_GLCDC_ClutUpdate	Updates the CLUT memory of the GLCDC.
R_GLCDC_GetStatus	Obtains the GLCDC status.
R_GLCDC_GetVersion	Returns the version number of the GLCDC FIT module.

## 1.4 State Transition

Figure 1.1 shows the state transition diagram of the GLCDC FIT module.

**Figure 1.1 State Transition Diagram of the GLCDC FIT Module**

## 1.5 Limitations

The GLCDC FIT module has the following limitations.

- Output of serial RGB data is not supported.
- Input of an external clock (LCD\_EXTCLK) is not supported.

## 2. API Information

The sample code in this application note has been run and confirmed under the following conditions.

### 2.1 Hardware Requirements

This FIT module requires that your MCU support the following features:

- GLCDC

### 2.2 Software Requirements

This FIT module is dependent upon the following packages:

- Renesas Board Support Package (r\_bsp). Rev.5.20 or higher.

### 2.3 Supported Toolchains

This FIT module is tested and working with toolchains listed in 6.1 Operation Confirmation Environment.

### 2.4 Interrupt Vector

When the R\_GLCDC\_Open function is executed, the VPOS, GR1UF, and GR2UF interrupts are enabled according to the parameter values.

Table 2.1 lists the interrupt vector used in the GLCDC FIT Module.

**Table 2.1 Interrupt Vector Used in the GLCDC FIT Module**

Device	Interrupt Vector
RX65N	GROUPAL1 interrupt (vector no. : 113)
RX72M	<ul style="list-style-type: none"><li>• VPOS interrupt (group interrupt source number: 8)</li><li>• GR1UF interrupt (group interrupt source number: 9)</li><li>• GR2UF interrupt (group interrupt source number: 10)</li></ul>

### 2.5 Header Files

All API calls and their supporting interface definitions are located in file "r\_glcdc\_rx\_if.h".

### 2.6 Integer Types

The GLCDC FIT module uses ANSI C99. These types are defined in file "stdint.h".

## 2.7 Configuration Overview

All configurable options that can be set at build time are located in file “r\_glcddc\_rx\_config.h”. A summary of these settings are provided in the following table.

Configuration options in r_glcddc_rx_config.h	
<code>GLCDDC_CFG_PARAM_CHECKING_ENABLE 1</code>	Defines whether to include parameter checking in the code or not. If the equate is set to 0, the parameter checking is omitted from the build and code size is reduced. If the equate is set to 1, parameter checking is included in the build.
<code>GLCDDC_CFG_INTERRUPT_PRIORITY_LEVEL 5</code>	Specifies the interrupt priority level for the group AL1 interrupt. Specify the level from 0 to 15.

## 2.8 Code Size

The sizes of ROM, RAM and maximum stack usage associated with this module are listed below. Information is listed for RX65N as a representative.

The ROM (code and constants) and RAM (global data) sizes are determined by the build-time configuration options described in 2.7 Configuration Overview.

The values in the table below are confirmed under the following conditions.

Module Revision: r\_glcdc\_rx rev1.20

Compiler Version: Renesas Electronics C/C++ Compiler Package for RX Family V3.01.00

(The option of “-lang = c99” is added to the default settings of the integrated development environment.)

GCC for Renesas RX 4.8.4.201801

(The option of “-std=gnu99” is added to the default settings of the integrated development environment.)

IAR C/C++ Compiler for Renesas RX version 4.10.1

(The default settings of the integrated development environment.)

Configuration Options: Default settings

ROM, RAM and Stack Code Sizes							
Device	Category	Memory Used					
		Renesas Compiler		GCC		IAR Compiler	
		With Parameter Checking	Without Parameter Checking	With Parameter Checking	Without Parameter Checking	With Parameter Checking	Without Parameter Checking
RX65N	ROM	5890 bytes	4714bytes	13128 bytes	10304 bytes	9675 bytes	7748 bytes
	RAM	114 bytes		24 bytes		44 bytes	
	STACK	184 bytes		- bytes		208 bytes	

## 2.9 Parameters

This section describes the API data structures used as arguments for the API functions. These structures are located in file "r\_glcde\_rx\_if.h" as are the prototype declarations.

```
/* Settings for the GLCDC Main */
typedef struct st_glcde_cfg
{
    /** Generic configuration for display devices */
    glcdc_input_cfg_t input[GLCDC_FRAME_LAYER_NUM]; // GLCDC input image setting
    glcdc_output_cfg_t output; // GLCDC output setting
    glcdc_blend_t blend[GLCDC_FRAME_LAYER_NUM]; // Setting for blending
    glcdc_chromakey_t chromakey[GLCDC_FRAME_LAYER_NUM]; // Setting for chroma key
    glcdc_clut_cfg_t clut[GLCDC_FRAME_LAYER_NUM]; // Setting for CLUT

    /** Interrupt setting */
    glcdc_detect_cfg_t detection; // GLCDC detection setting
    glcdc_interrupt_cfg_t interrupt; // GLCDC interrupt setting

    /** Setting upon occurrence of GLCDC events */
    void (*p_callback)(void *); // Pointer to the
                                // callback function
} glcdc_cfg_t;
```

```
/* GLCDC input image setting */
typedef struct st_glcde_input_cfg
{
    uint32_t * p_base; // Start address of the frame buffer
    uint16_t hsize; // Horizontal pixel size of image data
    uint16_t vsize; // Vertical pixel size of image data
    int32_t offset; // Offset value to the next line
    glcdc_in_format_t format; // Data format setting
    bool frame_edge; // Show/hide setting of the graphics area
                    // frame
    glcdc_coordinate_t coordinate; // Position to start displaying image data
    glcdc_color_t bg_color; // Background color setting for graphics
} glcdc_input_cfg_t;
```

```
/* GLCDC output setting */
typedef struct st_glcde_output_cfg
{
    glcdc_timing_t htiming; // Setting for horizontal synchronous
                           // signal (HSYNC) timing
    glcdc_timing_t vtiming; // Setting for vertical synchronous
                           // signal (VSYNC) timing
    glcdc_out_format_t format; // Setting for output data format
    glcdc_endian_t endian; // Bit endian setting for output data
    glcdc_color_order_t color_order; // Pixel sequence setting
    glcdc_sync_edge_t sync_edge; // Setting for output phase of HSYNC/VSYNC/data

    glcdc_color_t bg_color; // Setting for background color

    glcdc_brightness_t brightness; // Setting for brightness
    glcdc_contrast_t contrast; // Setting for contrast
    glcdc_gamma_correction_t gamma; // Setting for gamma correction
    glcdc_correction_proc_order_t correction_proc_order; // Setting for sequence
                                                         // of correction processing
    glcdc_dithering_t dithering; // Setting for dithering
```

```

    glcdc_tcon_pin_t tcon_hsync;           // Output pin setting for horizontal
                                           // sync signal (HSYNC)
    glcdc_tcon_pin_t tcon_vsync;           // Output pin setting for vertical
                                           // sync signal (VSYNC)
    glcdc_tcon_pin_t tcon_de;              // Output pin setting for data enable
                                           // signal (DE)
    glcdc_signal_polarity_t data_enable_polarity; // Polarity setting for data
                                           // enable signal (DE)

## 2.10 Return Value

This section describes return values for the API functions. This enumeration is located in file "r\_glcddetected\_status.h" as are the prototype declarations.

```
/* GLCDC return values */
typedef enum e_glcdderr
{
    GLCDC_SUCCESS = 0,                // Processing has been completed
                                      // successfully.
    GLCDC_ERR_INVALID_PTR,            // NULL pointer is passed to the parameter.
    GLCDC_ERR_LOCK_FUNC,              // GLCDC resource is used by another process
    GLCDC_ERR_INVALID_ARG,            // Invalid argument value
    GLCDC_ERR_INVALID_MODE,           // Function cannot be executed in this mode.
    GLCDC_ERR_NOT_OPEN,               // R_GLCDD_Open has not been executed.
    GLCDC_ERR_INVALID_TIMING_SETTING, // Register update timing is invalid.
    GLCDC_ERR_INVALID_LAYER_SETTING,  // Graphics screen setting is invalid.
    GLCDC_ERR_INVALID_ALIGNMENT,      // Start address of the frame buffer is
                                      // invalid.
    GLCDC_ERR_INVALID_GAMMA_SETTING,  // Gamma correction setting is invalid.
    GLCDC_ERR_INVALID_UPDATE_TIMING,  // Update timing of the register value is
                                      // invalid.
    GLCDC_ERR_INVALID_CLUT_ACCESS,    // CLUT memory setting is invalid.
    GLCDC_ERR_INVALID_BLEND_SETTING,  // Setting for blending is invalid.
} glcdc_err_t;
```

## 2.11 Callback Function

In the GLCDC FIT module, a callback function set up by the user is called when the VPOS interrupt, the GR1UF interrupt, or the GR2UF interrupt occurs.

The callback function is set up by storing the address of the callback function in the `p_callback` structure member described in 2.9 Parameters. When the callback function is called, the constant listed in Table 2.2 is passed as a parameter.

Since the argument type is passed as a pointer to void type, a variable of type pointer to void should be used as the callback function parameter. See an example below as a reference.

To use the argument in the function, its type should be cast.

Unintended specified line notification from graphic 2 (VPOS flag) and graphic 1,2 underflow (GR1UF flag, GR2UF flag) is detected only the first time after GLCDC software reset release. Therefore, do nothing with first VPOS interrupt processing after execution of `R_GLCDC_Open` function, execute user process from next interrupt.

**Table 2.2 Parameters for the Callback Function (enum `glcdc_event_t`)**

Constant Definition	Description
<code>GLCDC_EVENT_LINE_DETECTION</code>	Callback function called from the VPOS interrupt handling
<code>GLCDC_EVENT_GR1_UNDERFLOW</code>	Callback function called from the GR1UF interrupt handling
<code>GLCDC_EVENT_GR2_UNDERFLOW</code>	Callback function called from the GR2UF interrupt handling

```

/* Callback function example */
bool first_interrupt_flag = false;

void my_glcdc_callback(void * pdata)
{
    if (false == first_interrupt_flag)
    {
        first_interrupt_flag = true;
        /* do nothing */
    }
    else
    {
        glcdc_callback_args_t * pdecode;
        pdecode = (glcdc_callback_args_t *)pdata; // cast pointer to
                                                    // glcdc_callback_args_t
        ...
    }
}

```

---

## 2.12 Adding FIT Module to Your Project

---

This module must be added to each project in which it is used. Renesas recommends using “Smart Configurator” described in (1) or (3). However, “Smart Configurator” only supports some RX devices. Please use the methods of (2) or (4) for unsupported RX devices.

- (1) Adding the FIT module to your project using “Smart Configurator” in e<sup>2</sup> studio  
By using the “Smart Configurator” in e<sup>2</sup> studio, the FIT module is automatically added to your project. Refer to “Renesas e<sup>2</sup> studio Smart Configurator User Guide (R20AN0451)” for details.
- (2) Adding the FIT module to your project using “FIT Configurator” in e<sup>2</sup> studio  
By using the “FIT Configurator” in e<sup>2</sup> studio, the FIT module is automatically added to your project. Refer to “Adding Firmware Integration Technology Modules to Projects (R01AN1723)” for details.
- (3) Adding the FIT module to your project using “Smart Configurator” on CS+  
By using the “Smart Configurator Standalone version” in CS+, the FIT module is automatically added to your project. Refer to “Renesas e<sup>2</sup> studio Smart Configurator User Guide (R20AN0451)” for details.
- (4) Adding the FIT module to your project in CS+  
In CS+, please manually add the FIT module to your project. Refer to “Adding Firmware Integration Technology Modules to CS+ Projects (R01AN1826)” for details.

## 2.13 “for”, “while” and “do while” statements

In this module, “for”, “while” and “do while” statements (loop processing) are used in processing to wait for register to be reflected and so on. For these loop processing, comments with “WAIT\_LOOP” as a keyword are described. Therefore, if user incorporates fail-safe processing into loop processing, user can search the corresponding processing with “WAIT\_LOOP”.

### Target devices describing “WAIT\_LOOP”

- RX651, RX65N Group
- RX72M Group

The following shows example of description.

```
while statement example :
/* WAIT_LOOP */
while(0 == SYSTEM.OSCOVFSR.BIT.PLOVF)
{
    /* The delay period needed is to make sure that the PLL has stabilized. */
}

for statement example :
/* Initialize reference counters to 0. */
/* WAIT_LOOP */
for (i = 0; i < BSP_REG_PROTECT_TOTAL_ITEMS; i++)
{
    g_protect_counters[i] = 0;
}

do while statement example :
/* Reset completion waiting */
do
{
    reg = phy_read(ether_channel, PHY_REG_CONTROL);
    count++;
} while ((reg & PHY_CONTROL_RESET) && (count < ETHER_CFG_PHY_DELAY_RESET)); /* WAIT_LOOP */
```

### 3. API Functions

#### R\_GLCDC\_Open ()

This function initializes the GLCDC FIT module. This function must be called before calling any other API functions.

**Format**

```
glcdc_err_t R_GLCDC_Open (
    glcdc_cfg_t const * const p_cfg
    /* Pointer to the GLCDC setting data structure */
)
```

**Parameters**

*glcdc\_cfg\_t* \**p\_cfg*  
Pointer to the GLCDC setting data structure.

The following table lists the *glcdc\_cfg\_t* structure members and setting values to be referenced. Only parameters listed below are referenced. Thus the other parameters do not need to be specified when this function is executed.

**Table 3.1 glcdc\_cfg\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
output.htiming. back_porch	Horizontal back porch	See 5.1 Screen Definition.	Specifies the assertion timing of the STHy signal and the start position of the horizontal active display.
output.htiming. sync_width	Horizontal assertion width	See 5.1 Screen Definition.	Specifies the assertion timing of the STHy signal, the STHy signal assertion width, and the start position of the horizontal active display.
output.vtiming. back_porch	Vertical back porch	See 5.1 Screen Definition.	Specifies the assertion timing of the STVy signal and the start position of the vertical active display.
output.vtiming. sync_width	Vertical assertion width	See 5.1 Screen Definition.	Specifies the assertion timing of the STVy signal, the STVy signal assertion width, and the start position of the vertical active display.
output.htiming. display_cyc	Horizontal active display width	See 5.1 Screen Definition.	Specifies the STHy signal assertion width and the horizontal active display width.
output.vtiming. display_cyc	Vertical active display width	See 5.1 Screen Definition.	Specifies the STVy signal assertion width and the vertical active display width.
output.htiming. front_porch	Horizontal front porch	See 5.1 Screen Definition.	Specifies the horizontal active display width and the start position of horizontal active display.
output.vtiming. front_porch	Vertical front porch	See 5.1 Screen Definition.	Specifies the vertical active display width and the start

			position of vertical active display.
p_callback	Pointer to the callback function	Address of the callback function	Executes the callback function at the address designated by the pointer when an interrupt source occurs.
		FIT_NO_FUNC or NULL	The callback function is not executed even if an interrupt source occurs.
output.clksrc	Clock source	GLCDC_CLK_SRC_INTERNAL	PLL clock is used.
output.clock_div_ratio	Clock division ratio	1/1 to 1/32 (see "glcdc_panel_clk_div_t" in 0 Parameters for details.	Specifies the division ratio for LCD_CLK.
output.format	Output data format	GLCDC_OUT_FORMAT_24BITS_RGB888	Sets RGB888 as the output data format and the output format, and sets the pixel clock to 'no division'.
		GLCDC_OUT_FORMAT_18BITS_RGB666	Sets RGB666 as the output data format and the output format, and sets the pixel clock to 'no division'.
		GLCDC_OUT_FORMAT_16BITS_RGB565	Sets RGB565 as the output data format and the output format, and sets the pixel clock to 'no division'.
output.sync_edge	Output phase control for TCON and DATA	GLCDC_SIGNAL_SYNC_EDGE_RISING	Outputs synchronizing with a rising edge of LCD_CLK.
		GLCDC_SIGNAL_SYNC_EDGE_FALLING	Outputs synchronizing with a falling edge of LCD_CLK.
output.tcon_hsync	Output pin of the horizontal sync signal (HSYNC)	GLCDC_TCON_PIN_0	TCON0 is used for HSYNC output.
		GLCDC_TCON_PIN_1	TCON1 is used for HSYNC output.
		GLCDC_TCON_PIN_2	TCON2 is used for HSYNC output.
		GLCDC_TCON_PIN_3	TCON3 is used for HSYNC output.
output.hsync_polarity	Polarity of the horizontal sync signal (HSYNC)	GLCDC_SIGNAL_POLARITY_LOACTIVE	Sets polarity to low active.
		GLCDC_SIGNAL_POLARITY_HIACTIVE	Sets polarity to high active.
output.tcon_vsync	Output pin of the vertical sync signal (VSYNC)	GLCDC_TCON_PIN_0	TCON0 is used for VSYNC output.
		GLCDC_TCON_PIN_1	TCON1 is used for VSYNC output.

		GLCDC_TCON_PIN_2	TCON2 is used for VSYNC output.
		GLCDC_TCON_PIN_3	TCON3 is used for VSYNC output.
output.vsync_polarity	Polarity of the vertical sync signal (VSYNC)	GLCDC_SIGNAL_POLARITY_LOACTIVE	Sets polarity to low active.
		GLCDC_SIGNAL_POLARITY_HIACTIVE	Sets polarity to high active.
output.tcon_de	Output pin of the data enable signal (DE)	GLCDC_TCON_PIN_0	TCON0 is used for DE output.
		GLCDC_TCON_PIN_1	TCON1 is used for DE output.
		GLCDC_TCON_PIN_2	TCON2 is used for DE output.
		GLCDC_TCON_PIN_3	TCON3 is used for DE output.
output.data_enable_polarity	Polarity of the data enable signal (DE)	GLCDC_SIGNAL_POLARITY_LOACTIVE	Sets polarity to low active.
		GLCDC_SIGNAL_POLARITY_HIACTIVE	Sets polarity to high active.
output.bg_color.byte.r	R value for the background color	00h to FFh	Specifies the R value for the background color.
output.bg_color.byte.g	G value for the background color	00h to FFh	Specifies the G value for the background color.
output.bg_color.byte.b	B value for the background color	00h to FFh	Specifies the B value for the background color.
input.format	Data format of the frame buffer	GLCDC_IN_FORMAT_32BITS_ARGB8888	ARGB8888 is used.
		GLCDC_IN_FORMAT_32BITS_RGB888	RGB888 is used.
		GLCDC_IN_FORMAT_16BITS_RGB565	RGB565 is used.
		GLCDC_IN_FORMAT_16BITS_ARGB1555	ARGB1555 is used.
		GLCDC_IN_FORMAT_16BITS_ARGB4444	ARGB4444 is used.
		GLCDC_IN_FORMAT_CLUT8	8-bit CLUT is used.
		GLCDC_IN_FORMAT_CLUT4	4-bit CLUT is used.
		GLCDC_IN_FORMAT_CLUT1	1-bit CLUT is used.
input.p_base	Start address of the frame buffer	0000 0040h to FFFF FFC0h Lower 6 bits are 0.	Specifies the start address of the frame buffer.
		NULL	The target graphics becomes disabled.

			(Setting values of structure members under glcdc_cfg_t.input are ignored.)
input.bg_color.byte.r	R value for the background color of graphics 1 and 2	00h to FFh	Specifies the R value for the background color of graphics 1 and 2.
input.bg_color.byte.g	G value for the background color of graphics 1 and 2	00h to FFh	Specifies the G value for the background color of graphics 1 and 2.
input.bg_color.byte.b	B value for the background color of graphics 1 and 2	00h to FFh	Specifies the B value for the background color of graphics 1 and 2.
input.hsize	Horizontal width of image data	See 5.1 Screen Definition.	Specifies the horizontal width of image for graphics 1 and 2.
input.vsize	Vertical width of image data	See 5.1 Screen Definition.	Specifies the vertical width of image for graphics 1 and 2.
input.offset	Macro line offset	-32768 to 32704 (Multiple of 64)	Specifies the macro line offset for graphics 1 and 2.
input.frame_edge	Show/hide setting of the graphics area frame	true	Sets the graphics area frame to be displayed.
		false	Sets the graphics area frame not to be displayed.
input.coordinate.x	X-coordinate of display start position	See 5.1 Screen Definition.	Specifies the horizontal start position of the graphics area.
input.coordinate.y	Y-coordinate of display start position	See 5.1 Screen Definition.	Specifies the vertical start position of the graphics area.
blend.blend_control	Control setting for blending	GLCDC_BLEND_CONTROL_NONE	Disables alpha blending.
		GLCDC_BLEND_CONTROL_FADEIN	Sets to fade-in.
		GLCDC_BLEND_CONTROL_FADEOUT	Sets to fade-out.
		GLCDC_BLEND_CONTROL_FIXED	Sets to fixed alpha value.
		GLCDC_BLEND_CONTROL_PIXEL	Sets to per-pixel alpha blending.
blend.visible	Show/hide setting of the image	true	Sets the image to be displayed.
		false	Sets the image not to be displayed.
blend.frame_edge	Show/hide setting of the rectangle	true	Sets the frame of the rectangle alpha blending area to be displayed.

	alpha blending area frame	false	Sets the frame of the rectangle alpha blending area not to be displayed.
blend.fixed_blend_value	Fixed alpha value	00h to FFh	Specifies the fixed alpha value (valid only when blend_control is 'GLCDC_BLEND_CONTROL_FIXED').
blend.fade_speed	Alpha value to be increased/decreased	00h to FFh	Specifies the alpha value to be increased or decreased (valid only when blend_control is 'GLCDC_BLEND_CONTROL_FADEIN' or 'GLCDC_BLEND_CONTROL_FADEOUT').
blend.start_coordinate.x	X-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the horizontal width of the rectangle alpha blending area and the horizontal start position of the rectangle alpha blending.
blend.end_coordinate.x	X-coordinate of the blending end position	See 5.1 Screen Definition.	
blend.start_coordinate.y	Y-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the vertical width of the rectangle alpha blending area and the vertical start position of the rectangle alpha blending.
blend.end_coordinate.y	Y-coordinate of the blending end position	See 5.1 Screen Definition.	
chromakey.enbale	Enable/disable setting of chroma key	true	Enables chroma keying.
		false	Disables chroma keying. (Setting values of structure members under glcdc_cfg_t.chromakey are ignored.)
chromakey.before.byte.r	R value for chroma keying	00h to FFh	Specifies the R value for chroma keying.
chromakey.before.byte.g	G value for chroma keying	00h to FFh	Specifies the G value for chroma keying.
chromakey.before.byte.b	B value for chroma keying	00h to FFh	Specifies the B value for chroma keying.
chromakey.after.byte.a	A value after chroma key replacement	00h to FFh	Specifies the A value after replacement by chroma keying
chromakey.after.byte.r	R value after chroma key replacement	00h to FFh	Specifies the R value after replacement by chroma keying
chromakey.after.byte.g	G value after chroma key replacement	00h to FFh	Specifies the G value after replacement by chroma keying

chromakey.after.byte.b	B value after chroma key replacement	00h to FFh	Specifies the B value after replacement by chroma keying
output.endian	Bit endianness of the output data	GLCDC_ENDIAN_LITTLE	Sets to little endian.
		GLCDC_ENDIAN_BIG	Sets to big endian.
output.color_order	Pixel sequence of the output data	GLCDC_COLOR_ORDER_RGB	Sets the pixel sequence of the output data to R-G-B in order.
		GLCDC_COLOR_ORDER_BGR	Sets the pixel sequence of the output data to B-G-R in order.
output.correction_proc_order	Sequence of correction processing	GLCDC_BRIGHTNESS_CONTRAST_TO_GAMMA	Performs brightness and contrast adjustments first, and then gamma correction.
		GLCDC_GAMMA_TO_BRIGHTNESS_CONTRAST	Performs gamma correction first, and then brightness and contrast adjustments.
output.dithering.dithering_on	Dithering mode selection	true	Sets to '0: truncated, 1: rounded' or dithering with 2x2 pattern.
		false	Sets to 'truncated'. (Setting values of structure members under glcdc_cfg_t.output.dithering are ignored.)
output.dithering.dithering_mode	Dithering mode selection 2	GLCDC_DITHERING_MODE_ROUND_OFF	Sets to '0: truncated, 1: rounded'.
		GLCDC_DITHERING_MODE_2X2PATTERN	Sets to dithering with 2x2 pattern.
output.dithering.dithering_pattern_a	Dithering pattern value A	GLCDC_DITHERING_PATTERN_00	Specifies pattern value A of dithering with 2x2 pattern (valid only when dithering_mode is 'GLCDC_DITHERING_MODE_2X2PATTERN').
		GLCDC_DITHERING_PATTERN_01	
		GLCDC_DITHERING_PATTERN_10	
		GLCDC_DITHERING_PATTERN_11	
output.dithering.dithering_pattern_b	Dithering pattern value B	GLCDC_DITHERING_PATTERN_00	Specifies pattern value B of dithering with 2x2 pattern (valid only when dithering_mode is 'GLCDC_DITHERING_MODE_2X2PATTERN').
		GLCDC_DITHERING_PATTERN_01	
		GLCDC_DITHERING_PATTERN_10	
		GLCDC_DITHERING_PATTERN_11	
output.dithering.dithering_pattern_c	Dithering pattern value C	GLCDC_DITHERING_PATTERN_00	Specifies pattern value C of dithering with 2x2 pattern

		GLCDC_DITHERING_PATTERN_01	(valid only when dithering_mode is 'GLCDC_DITHERING_MODE_2X2PATTERN').
		GLCDC_DITHERING_PATTERN_10	
		GLCDC_DITHERING_PATTERN_11	
output.dithering. dithering_pattern_d	Dithering pattern value D	GLCDC_DITHERING_PATTERN_00	Specifies pattern value D of dithering with 2x2 pattern (valid only when dithering_mode is 'GLCDC_DITHERING_MODE_2X2PATTERN').
		GLCDC_DITHERING_PATTERN_01	
		GLCDC_DITHERING_PATTERN_10	
		GLCDC_DITHERING_PATTERN_11	
output.brightness. enable	Enable/disable setting of brightness adjustment	true	Enables brightness adjustment.
		false	Disables brightness adjustment. (Values for RGB brightness adjustment are set to 0 regardless of setting values of structure members under glcdc_cfg_t.output.brightness.)
output.brightness.r	Brightness adjust. value for R signal	0000h: -512 :	Specifies the brightness adjustment value for the R signal.
output.brightness.g	Brightness adjust. value for G signal	200h: 0 :	Specifies the brightness adjustment value for the G signal.
output.brightness.b	Brightness adjust. value for B signal	3FFh: +511	Specifies the brightness adjustment value for the B signal.
output.contrast.enable	Enable/disable setting of contrast adjustment	true	Enables contrast adjustment.
		false	Disables contrast adjustment. (Values for RGB contrast adjustment are set to 1.000 regardless of setting values of structure members under glcdc_cfg_t.output.contrast.)
output.contrast.r	Contrast adjustment value for R signal	00h: 0/128 = 0.000 :	Specifies the contrast adjustment value for the R signal.
output.contrast.g	Contrast adjustment value for G signal	80h: 128/128 = 1.000 :	Specifies the contrast adjustment value for the G signal.
output.contrast.b	Contrast adjustment value for B signal	FFh: 255/128 = 1.992	Specifies the contrast adjustment value for the B signal.

output.gamma.enable	Enable/disable setting of gamma correction	true	Enables gamma correction.
		false	Disables gamma correction. (Setting values of structure members under glcdc_cfg_t.output.gamma are ignored.)
output.gamma.p_r	Gamma correction table for the R signal	See 5.2 Calculating Gamma Correction Value.	Specifies the gain value and the start threshold value for each R signal area.
output.gamma.p_g	Gamma correction table for the G signal	See 5.2 Calculating Gamma Correction Value.	Specifies the gain value and the start threshold value for each G signal area.
output.gamma.p_b	Gamma correction table for the B signal	See 5.2 Calculating Gamma Correction Value.	Specifies the gain value and the start threshold value for each B signal area.
clut.enable	Enable/disable setting of CLUT memory	true	Update CLUT memory.
		false	Not update CLUT memory. (Setting values of structure members under glcdc_cfg_t.clut are ignored.)
clut.p_base	Pointer to the start address of the CLUT memory	Other than NULL	Reads the value at the address designated by the pointer and copies it to the CLUT memory.
clut.start	Start entry number of the CLUT memory to be updated	0 to 255 (start + size < 257)	Starts updating the CLUT memory from the entry number specified.
clut.size	Entry size of the CLUT memory to be updated	1 to 256 (start + size < 257)	Updates the CLUT memory for the specified size.
detection.vpos_detect	Enable/disable setting of VPOS detection	true	Enables VPOS detection.
		false	Disables VPOS detection.
detection.gr1uf_detect	Enable/disable setting of GR1UF detection	true	Enables GR1UF detection.
		false	Disables GR1UF detection.
detection.gr2uf_detect	Enable/disable setting of GR2UF detection	true	Enables GR2UF detection.
		false	Disables GR2UF detection.
interrupt.vpos_enable	Enable/disable setting of the VPOS interrupt	true	Enables the VPOS interrupt.
		false	Disables the VPOS interrupt.
interrupt.gr1uf_enable	Enable/disable setting of the GR1UF interrupt	true	Enables the GR1UF interrupt.
		false	Disables the GR1UF interrupt.

interrupt.gr2uf_enable	Enable/disable setting of the GR2UF interrupt	true	Enables the GR2UF interrupt.
		false	Disables the GR2UF interrupt.

**Return Values**

<code>GLCDC_SUCCESS</code>	<i>/* Processing has been completed successfully. */</i>
<code>GLCDC_ERR_INVALID_PTR</code>	<i>/* The p_cfg parameter is NULL pointer. */</i>
<code>GLCDC_ERR_LOCK_FUNC</code>	<i>/* GLCDC resource is used by another process */</i>
<code>GLCDC_ERR_INVALID_ARG</code>	<i>/* The argument for the GLCDC setting data is invalid. */</i>
<code>GLCDC_ERR_INVALID_MODE</code>	<i>/* Function cannot be executed in this mode. */</i>
<code>GLCDC_ERR_INVALID_TIMING_SETTING</code>	<i>/* Timing setting of the panel output signal is invalid. */</i>
<code>GLCDC_ERR_INVALID_LAYER_SETTING</code>	<i>/* Graphics screen setting is invalid. */</i>
<code>GLCDC_ERR_INVALID_ALIGNMENT</code>	<i>/* Start address of the frame buffer is invalid. */</i>
<code>GLCDC_ERR_INVALID_GAMMA_SETTING</code>	<i>/* Gamma correction setting is invalid. */</i>
<code>GLCDC_ERR_INVALID_CLUT_ACCESS</code>	<i>/* CLUT memory setting is invalid. */</i>
<code>GLCDC_ERR_INVALID_BLEND_SETTING</code>	<i>/* Setting for blending is invalid. */</i>

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

This function releases the GLCDC module-stop state and software reset to enable the GLCDC operation. Then it specifies the panel clock, the panel output signal timing, background screen, graphics screen, CLUT memory, output data format, correction processing, and interrupts used by the GLCDC. This function can be executed when the mode is 'GLCDC\_STATE\_CLOSED'. When processing in this function has been completed successfully, a transition is made to 'GLCDC\_STATE\_NOT\_DISPLAYING'.

**Reentrant**

No.

**Example**

```
volatile glcdc_err_t ret_glcdc;
glcdc_cfg_t p_cfg;

p_cfg.htiming.back_porch = 2;
... // Set arguments parameter.
p_cfg.interrupt.gr2uf_enable = true;

ret_glcdc = R_GLCDC_Open(&p_cfg);
if (GLCDC_SUCCESS != ret_glcdc)
{
    /* error processing */
}
```

**Special Notes:**

- If the target graphics screen is disabled by setting p\_base to NULL in this function

The graphics screen setting in the R\_GLCDC\_LayerChange function and CLUT memory updates in the R\_GLCDC\_ClutUpdate function becomes disabled. To enable the disabled graphics, execute the R\_GLCDC\_Open function again and set the target graphics screen to be enabled.

- Notes on macro line offset setting

On the hardware specification, since data is read from the frame buffer for every 64 bytes, set a multiple of 64 for structure member input.offset (macro line offset). If it is not possible to observe this restriction, refer to 5.5 When Macro Line Offset Restrictions Cannot Be Followed.

---

**R\_GLCDC\_Close ()**

---

This function closes the GLCDC FIT module.

**Format**

```
glcdc_err_t R_GLCDC_Close (  
    void  
)
```

**Parameters**

None.

**Return Values**

<i>GLCDC_SUCCESS</i>	<i>/* Processing has been completed successfully. */</i>
<i>GLCDC_ERR_NOT_OPEN</i>	<i>/* R_GLCDC_Open has not been executed. */</i>
<i>GLCDC_ERR_INVALID_MODE</i>	<i>/* Function cannot be executed in this mode. */</i>

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

To close the GLCDC FIT module, this function disables interrupts used by the GLCDC. Then it executes the software reset and place the GLCDC in the module-stop state.

This function can be executed when the mode is 'GLCDC\_STATE\_NOT\_DISPLAYING'. When processing in this function has been completed successfully, a transition is made to 'GLCDC\_STATE\_CLOSED'.

**Reentrant**

No.

**Example**

```
volatile glcdc_err_t ret_glcdc;  
  
ret_glcdc = R_GLCDC_Close();  
if (GLCDC_SUCCESS != ret_glcdc)  
{  
    /* error processing */  
}
```

**Special Notes:**

When this function is executed, registers except registers associated with the CLUT memory are initialized. To enable GLCDC operation again, specify necessary settings again when the R\_GLCDC\_Open function is executed.

**R\_GLCDC\_Control ()**

This function performs processing according to the control command.

**Format**

```
glcdc_err_t R_GLCDC_Control (
    glcdc_control_cmd_t cmd      /* Control command */
    void const * const p_args    /* Pointer to the setting parameters */
                                /* structure */
)
```

**Parameters**

*glcdc\_control\_cmd\_t*    *cmd*

Control command to specify.

*void const \* const*        *p\_args*

Pointer to the setting parameters structure.

The following table lists available control commands. A void pointer set to the argument is cast to an appropriate type and processed.

**Table 3.2 Control Commands of the R\_GLCDC\_Control Function**

Command	Description	Type Set to p_args
GLCDC_CMD_START_DISPLAY	Enables GLCDC operation and outputs image data on the LCD panel. This command can be executed when the mode is 'GLCDC_STATE_NOT_DISPLAYING'. When processing for this command has been completed successfully, a transition is made to 'GLCDC_STATE_DISPLAYING'.	Not used. Set NULL or FIT_NO_FUNC.
GLCDC_CMD_STOP_DISPLAY	Disables GLCDC operation. This command can be executed when the mode is 'GLCDC_STATE_DISPLAYING'. When processing for this command has been completed successfully, a transition is made to 'GLCDC_STATE_NOT_DISPLAYING'.	Not used. Set NULL or FIT_NO_FUNC.
GLCDC_CMD_SET_INTERRUPT	Specifies interrupts used by the GLCDC. This command can be called at any time after the R_GLCDC_Open function is executed. The mode remains unchanged after processing for this command is complete.	glcdc_interrupt_cfg_t *
GLCDC_CMD_CLR_DETECTED_STATUS	Clears the status flag for detection of graphics 2 specified line notification, detection of graphics 1 underflow, and detection of graphics 2 underflow. This command can be called at any time after the R_GLCDC_Open function is executed. The mode remains unchanged after processing for this command is complete.	glcdc_detect_cfg_t *
GLCDC_CMD_CHANGE_BG_COLOR	Specifies background color of the background screen. The mode remains unchanged after processing for this command is complete.	glcdc_color_t *

The following lists the glcdc\_interrupt\_cfg\_t structure members and setting values to be referenced.

When the GLCDC\_CMD\_SET\_INTERRUPT command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.3 glcdc\_interrupt\_cfg\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
vpos_enable	Enable/disable setting of the VPOS interrupt	true	Enables the VPOS interrupt.
		false	Disables the VPOS interrupt.
gr1uf_enable	Enable/disable setting of the GR1UF interrupt	true	Enables the GR1UF interrupt.
		false	Disables the GR1UF interrupt.
gr2uf_enable	Enable/disable setting of the GR2UF interrupt	true	Enables the GR2UF interrupt.
		false	Disables the GR2UF interrupt.

The following lists the glcdc\_detect\_cfg\_t structure members and setting values to be referenced. When the GLCDC\_CMD\_CLR\_DETECTED\_STATUS command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.4 glcdc\_detect\_cfg\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
vpos_detect	Clearing the VPOS detection flag	true	Clears the VPOS detection flag.
		false	Not clear the VPOS detection flag.
gr1uf_detect	Clearing the GR1UF detection flag	true	Clears the GR1UF detection flag.
		false	Not clear the GR1UF detection flag.
gr2uf_detect	Clearing the GR2UF detection flag	true	Clears the GR2UF detection flag.
		false	Not clear the GR2UF detection flag.

The following lists the glcdc\_color\_t structure members and setting values to be referenced. When the GLCDC\_CMD\_CHANGE\_BG\_COLOR command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.5 glcdc\_color\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
byte.r	R value of the background color	00h to FFh	Specifies R value of the background color
byte.g	G value of the background color	00h to FFh	Specifies G value of the background color
byte.b	B value of the background color	00h to FFh	Specifies B value of the background color

**Return Values**

<code>GLCDC_SUCCESS</code>	<i>/* Processing has been completed successfully. */</i>
<code>GLCDC_ERR_INVALID_PTR</code>	<i>/* The p_args parameter is NULL pointer. */</i>
<code>GLCDC_ERR_INVALID_ARG</code>	<i>/* The argument set is invalid. */</i>
<code>GLCDC_ERR_INVALID_MODE</code>	<i>/* Function cannot be executed in this mode. */</i>
<code>GLCDC_ERR_NOT_OPEN</code>	<i>/* R_GLCDC_Open has not been executed. */</i>
<code>GLCDC_ERR_INVALID_UPDATE_TIMING</code>	<i>/* Update timing of the register is invalid. */</i>

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

This function performs GLCDC control processing according to the control command.

**Reentrant**

No.

**Example**

```
/* Enables GLCDC operation */
volatile glcdc_err_t ret_glcdc;

ret_glcdc = R_GLCDC_Control(GLCDC_CMD_START_DISPLAY, NULL);
if (GLCDC_SUCCESS != ret_glcdc)
{
    /* error processing */
}
```

```
/* Disables GLCDC operation */
volatile glcdc_err_t ret_glcdc;

ret_glcdc = R_GLCDC_Control(GLCDC_CMD_STOP_DISPLAY, NULL);
if (GLCDC_SUCCESS != ret_glcdc)
{
    /* error processing */
}
```

```
/* Changes enable/disable setting of the GLCDC interrupt */
volatile glcdc_err_t ret_glcdc;
glcdc_interrupt_cfg_t int_cfg;

int_cfg.vpos_enable = true;
int_cfg.gr1uf_enable = true;
int_cfg.gr2uf_enable = true;

ret_glcdc = R_GLCDC_Control(GLCDC_CMD_SET_INTERRUPT, (void *)&int_cfg);
if (GLCDC_SUCCESS != ret_glcdc)
{
    /* error processing */
}
```

```
/* Clears the GLCDC detection status */
volatile glcdc_err_t ret_glcde;
glcdc_detect_cfg_t detect_cfg;

detect_cfg.vpos_detect = true;
detect_cfg.gr1uf_detect = true;
detect_cfg.gr2uf_detect = true;

ret_glcde = R_GLCDC_Control(GLCDC_CMD_CLR_DETECTED_STATUS, (void *)&detect_cfg);
if (GLCDC_SUCCESS != ret_glcde)
{
    /* error processing */
}
```

```
/* Changes the GLCDC background color */
volatile glcdc_err_t ret_glcde;
glcdc_color_t bg_color;

bg_color.byte.r = 0xFFh;
bg_color.byte.g = 0xFFh;
bg_color.byte.b = 0xFFh;

ret_glcde = R_GLCDC_Control(GLCDC_CMD_CHANGE_BG_COLOR, (void *)&bg_color);
if (GLCDC_SUCCESS != ret_glcde)
{
    /* error processing */
}
```

**Special Notes:**

When the GLCDC\_CMD\_STOP\_DISPLAY command is executed, the GLCDC stops its operation after the frame end of background generating block. To enable GLCDC operation again, wait for the frame end of an output signal to the LCD panel, and then enable GLCDC operation. Otherwise, the GLCDC may not operate correctly depending on the LCD panel used.

**R\_GLCDC\_LayerChange ()**

This function changes operation of graphics 1 and graphics 2.

**Format**

```
glcdc_err_t R_GLCDC_LayerChange (
    glcdc_frame_layer_t frame      /* Graphics screen to change operation */
    glcdc_runtime_cfg_t const * const p_args /* Pointer to the setting
                                              /* parameter structure */
```

**Parameters**

*glcdc\_frame\_layer\_t*     *frame*

Graphics screen to change operation.

*void const \* const*     *p\_args*

Pointer to the setting parameters structure.

The following lists the *glcdc\_runtime\_cfg\_t* structure members and setting values to be referenced.

When this function is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.6 glcdc\_runtime\_cfg\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
input.format	Data format of the frame buffer	GLCDC_IN_FORMAT_32BITS_ARGB8888	ARGB8888 is used.
		GLCDC_IN_FORMAT_32BITS_RGB888	RGB888 is used.
		GLCDC_IN_FORMAT_16BITS_RGB565	RGB565 is used.
		GLCDC_IN_FORMAT_16BITS_ARGB1555	ARGB1555 is used.
		GLCDC_IN_FORMAT_16BITS_ARGB4444	ARGB4444 is used.
		GLCDC_IN_FORMAT_CLUT8	8-bit CLUT is used.
		GLCDC_IN_FORMAT_CLUT4	4-bit CLUT is used.
		GLCDC_IN_FORMAT_CLUT1	1-bit CLUT is used.
input.p_base	Start address of the frame buffer	0000 0040h to FFFF FFC0h Lower 6 bits are 0.	Specifies the start address of the frame buffer.
input.bg_color.byte.r	R value of the background color for graphics 1 and 2.	00 to FFh	Specifies the R value of the background color for graphics 1 and 2.
input.bg_color.byte.g	G value of the background color for graphics 1 and 2.	00 to FFh	Specifies the G value of the background color for graphics 1 and 2.
input.bg_color.byte.b	B value of the background color for graphics 1 and 2.	00 to FFh	Specifies the B value of the background color for graphics 1 and 2.
input.hsize	Horizontal width of image data	See 5.1 Screen Definition.	Specifies the horizontal width of image for graphics 1 and 2.

input.vsize	Vertical width of image data	See 5.1 Screen Definition.	Specifies the vertical width of image for graphics 1 and 2.
input.offset	Macro line offset	-32768 to 32704 (Multiple of 64)	Specifies the macro line offset for graphics 1 and 2.
input.frame_edge	Show/hide setting of the graphics area frame	true	Sets the graphics area frame to be displayed.
		false	Sets the graphics area frame not to be displayed.
input.coordinate.x	X-coordinate of display start position	See 5.1 Screen Definition.	Specifies the horizontal start position of the graphics area.
input.coordinate.y	Y-coordinate of display start position	See 5.1 Screen Definition.	Specifies the vertical start position of the graphics area.
blend.blend_control	Control setting for blending	GLCDC_BLEND_CONTROL_NONE	Disables alpha blending.
		GLCDC_BLEND_CONTROL_FADEIN	Sets to fade-in.
		GLCDC_BLEND_CONTROL_FADEOUT	Sets to fade-out.
		GLCDC_BLEND_CONTROL_FIXED	Sets to fixed alpha value.
		GLCDC_BLEND_CONTROL_PIXEL	Sets to per-pixel alpha blending.
blend.visible	Show/hide setting of the image	true	Sets the image to be displayed.
		false	Sets the image not to be displayed.
blend.frame_edge	Show/hide setting of the rectangle alpha blending area frame	true	Sets the rectangle alpha blending area frame to be displayed.
		false	Sets the rectangle alpha blending area frame not to be displayed.
blend.fixed_blend_value	Fixed alpha value	00h to FFh	Specifies the fixed alpha value (valid only when blend_control is 'GLCDC_BLEND_CONTROL_FIXED').

blend.fade_speed	Alpha value to be increased/decreased	00h to FFh	Specifies the alpha value to be increased or decreased (valid only when blend_control is 'GLCDC_BLEND_CONTROL_FADEIN' or 'GLCDC_BLEND_CONTROL_FADEOUT').
blend.start_coordinate.x	X-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the horizontal width of the rectangle alpha blending area and the horizontal start position of the rectangle alpha blending.
blend.end_coordinate.x	X-coordinate of the blending end position	See 5.1 Screen Definition.	
blend.start_coordinate.y	Y-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the vertical width of the rectangle alpha blending area and the vertical start position of the rectangle alpha blending.
blend.end_coordinate.y	Y-coordinate of the blending end position	See 5.1 Screen Definition.	
chromakey.enbale	Enable/disable setting of chroma keying	true	Enables chroma keying.
		false	Disables chroma keying. (Setting value of structure members under glcdc_runtime_cfg_t.chromakey are ignored.)
chromakey.before.byte.r	R value for chroma keying	00h to FFh	Specifies the R value for chroma keying.
chromakey.before.byte.g	G value for chroma keying	00h to FFh	Specifies the G value for chroma keying.
chromakey.before.byte.b	B value for chroma keying	00h to FFh	Specifies the B value for chroma keying.
chromakey.after.byte.a	A value after chroma key replacement	00h to FFh	Specifies the A value after replacement by chroma keying
chromakey.after.byte.r	R value after chroma key replacement	00h to FFh	Specifies the R value after replacement by chroma keying
chromakey.after.byte.g	G value after chroma key replacement	00h to FFh	Specifies the G value after replacement by chroma keying
chromakey.after.byte.b	B value after chroma key replacement	00h to FFh	Specifies the B value after replacement by chroma keying

**Return Values**

<code>GLCDC_SUCCESS</code>	<i>/* Processing has been completed successfully. */</i>
<code>GLCDC_ERR_INVALID_PTR</code>	<i>/* The p_args parameter is NULL pointer. */</i>
<code>GLCDC_ERR_INVALID_ARG</code>	<i>/* The argument set is invalid. */</i>
<code>GLCDC_ERR_INVALID_MODE</code>	<i>/* Function cannot be executed in this mode. */</i>
<code>GLCDC_ERR_NOT_OPEN</code>	<i>/* R_GLCDC_Open has not been executed. */</i>
<code>GLCDC_ERR_INVALID_UPDATE_TIMING</code>	<i>/* Update timing of the register is invalid. */</i>
<code>GLCDC_ERR_INVALID_LAYER_SETTING</code>	<i>/* Graphics screen setting is invalid. */</i>
<code>GLCDC_ERR_INVALID_ALIGNMENT</code>	<i>/* Start address of the frame buffer is invalid. */</i>
<code>GLCDC_ERR_INVALID_BLEND_SETTING</code>	<i>/* Setting for blending is invalid. */</i>

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

This function changes operation of graphics 1 and 2.

This function can be executed when the mode is 'GLCDC\_STATE\_DISPLAYING'. The mode remains unchanged after processing in this function is complete.

**Reentrant**

No.

**Example**

```
/* Changes settings for graphics 1 */
volatile glcdc_err_t ret_glcde;
glcdc_frame_layer_t frame;
glcdc_runtime_cfg_t runtime_cfg;

frame = GLCDC_FRAME_LAYER_1;

runtime_cfg.input.format = GLCDC_IN_FORMAT_CLUT8;
runtime_cfg.input.p_base = (uint32_t *)0x00800000;
runtime_cfg.input.hsize = 448;
runtime_cfg.input.vsize = 253;
runtime_cfg.input.offset = 448;
runtime_cfg.input.frame_edge = false;
runtime_cfg.input.bg_color.byte.r = 0xCC;
runtime_cfg.input.bg_color.byte.g = 0xCC;
runtime_cfg.input.bg_color.byte.b = 0xCC;
runtime_cfg.input.coordinate.x = 16;
runtime_cfg.input.coordinate.y = 9;

runtime_cfg.blend.blend_control = GLCDC_BLEND_CONTROL_NONE;
runtime_cfg.blend.visible = true;
runtime_cfg.blend.frame_edge = false;
runtime_cfg.blend.fixed_blend_value = 0x00;
runtime_cfg.blend.fade_speed = 0x00;
runtime_cfg.blend.start_coordinate.x = 0;
runtime_cfg.blend.start_coordinate.y = 0;
runtime_cfg.blend.end_coordinate.x = 0;
runtime_cfg.blend.end_coordinate.y = 0;

runtime_cfg.chromakey.enable = false;
runtime_cfg.chromakey.before.byte.g = 0x00;
runtime_cfg.chromakey.before.byte.b = 0x00;
runtime_cfg.chromakey.before.byte.r = 0x00;
runtime_cfg.chromakey.after.byte.a = 0x00;
runtime_cfg.chromakey.after.byte.g = 0x00;
runtime_cfg.chromakey.after.byte.b = 0x00;
runtime_cfg.chromakey.after.byte.r = 0x00;

ret_glcde = R_GLCDC_LayerChange(frame, &runtime_cfg);
if (GLCDC_SUCCESS != ret_glcde)
{
    /* error processing */
}
```

**Special Notes:**

None.

**R\_GLCDC\_ColorCorrection ()**

This function changes settings for brightness, contrast, and gamma correction of the GLCDC.

**Format**

```
glcdc_err_t R_GLCDC_ColorCorrection (
    glcdc_correction_cmd_t cmd      /* Command to change the setting */
    void const * const p_args      /* Pointer to the setting parameter */
    /* structure */
)
```

**Parameters**

*glcdc\_correction\_cmd\_t*                      *cmd*  
Command to change the setting

*void const \* const*                      *p\_args*  
Pointer to the setting parameter structure

The following table lists the available control commands. A void pointer set to the argument is cast to an appropriate type and processed.

**Table 3.7 Control Commands of the R\_GLCDC\_ColorCorrection Function**

Command	Description	Type Set to p_args
GLCDC_CORRECTION_CMD_SET_ALL	Specifies settings for brightness and contrast adjustments, and gamma correction.	glcdc_correction_t *
GLCDC_CORRECTION_CMD_BRIGHTNESS	Specifies the setting for brightness adjustment.	glcdc_brightness_t *
GLCDC_CORRECTION_CMD_CONTRAST	Specifies the setting for contrast adjustment.	glcdc_contrast_t *
GLCDC_CORRECTION_CMD_GAMMA	Specifies the setting for gamma correction.	glcdc_gamma_correction_t *

The following lists the `glcdc_correction_t` structure members and setting values to be referenced. When the `GLCDC_CORRECTION_CMD_SET_ALL` command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.8 glcdc\_correction\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
brightness.enable	Enable/disable setting of brightness adjustment	true	Enables brightness adjustment.
		false	Disables brightness adjustment. (Values for RGB brightness adjustment are set to 0 regardless of setting values of the structure members under <code>glcdc_correction_t.brightness</code> .)
brightness.r	Brightness adjust. value for R signal	000h: -512 : 200h: 0 : 3FFh: +511	Specifies the brightness adjustment value for the R signal.
brightness.g	Brightness adjust. value for G signal		Specifies the brightness adjustment value for the G signal.
brightness.b	Brightness adjust. value for B signal		Specifies the brightness adjustment value for the B signal.
contrast.enable	Enable/disable setting of contrast adjustment	true	Enables contrast adjustment.
		false	Disables contrast adjustment. (Values for RGB contrast adjustment are set to 1.000 regardless of setting values of structure members under <code>glcdc_correction_t.contrast</code> )
contrast.r	Contrast adjustment value for R signal	00h: $0/128 = 0.000$ : 80h: $128/128 = 1.000$ : FFh: $255/128 = 1.992$	Specifies the contrast adjustment value for the R signal.
contrast.g	Contrast adjustment value for G signal		Specifies the contrast adjustment value for the G signal.
contrast.b	Contrast adjustment value for B signal		Specifies the contrast adjustment value for the B signal.
gamma.enable	Enable/disable setting of gamma correction	true	Enables gamma correction.
		false	Disables gamma correction. (Setting values of structure members under <code>glcdc_correction_t.gamma</code> are ignored.)
gamma.p_r	Gamma correction table for the R signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each R signal area.

gamma.p_g	Gamma correction table for the G signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each G signal area.
gamma.p_b	Gamma correction table for the B signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each B signal area.

The following lists the `glcdc_brightness_t` structure members and setting values to be referenced. When the `GLCDC_CORRECTION_CMD_BRIGHTNESS` command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.9 glcdc\_brightness\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
enable	Enable/disable setting of brightness adjustment	true	Enables brightness adjustment.
		false	Disables brightness adjustment. (Values for RGB brightness adjustment are set to 0 regardless of setting values of structure members under <code>glcdc_brightness_t</code> .)
r	Brightness adjust. value for R signal	000h: -512 : 200h: 0 : 3FFh: +511	Specifies the brightness adjustment value for the R signal.
g	Brightness adjust. value for G signal		Specifies the brightness adjustment value for the G signal.
b	Brightness adjust. value for B signal		Specifies the brightness adjustment value for the B signal.

The following lists the `glcdc_contrast_t` structure members and setting values to be referenced. When the `GLCDC_CORRECTION_CMD_CONTRAST` command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.10 glcdc\_contrast\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
enable	Enable/disable setting of contrast adjustment	true	Enables contrast adjustment.
		false	Disables contrast adjustment. (Values for RGB contrast adjustment are set to 1.000 regardless of setting values of structure members under <code>glcdc_contrast_t</code> .)
r	Contrast adjustment value for R signal	00h: 0/128 = 0.000 :	Specifies the contrast adjustment value for the R signal.

g	Contrast adjustment value for G signal	80h: $128/128 = 1.000$ :	Specifies the contrast adjustment value for the G signal.
b	Contrast adjustment value for B signal	FFh: $255/128 = 1.992$	Specifies the contrast adjustment value for the B signal.

The following lists the `glcdc_gamma_correction_t` structure members and setting values to be referenced. When the `GLCDC_CORRECTION_CMD_GAMMA` command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.11 glcdc\_gamma\_correction\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
enable	Enable/disable setting of gamma correction	true	Enables gamma correction.
		false	Disables gamma correction. (Setting values of structure members under <code>glcdc_gamma_correction_t</code> are ignored.)
p_r	Gamma correction table for the R signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each R signal area.
p_g	Gamma correction table for the G signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each G signal area.
p_b	Gamma correction table for the B signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each B signal area.

### Return Values

<code>GLCDC_SUCCESS</code>	<i>/* Processing has been completed successfully. */</i>
<code>GLCDC_ERR_INVALID_PTR</code>	<i>/* The p_args parameter is NULL pointer. */</i>
<code>GLCDC_ERR_INVALID_ARG</code>	<i>/* The argument set is invalid. */</i>
<code>GLCDC_ERR_INVALID_MODE</code>	<i>/* Function cannot be executed in this mode. */</i>
<code>GLCDC_ERR_NOT_OPEN</code>	<i>/* R_GLCDC_Open has not been executed. */</i>
<code>GLCDC_ERR_INVALID_UPDATE_TIMING</code>	<i>/* Update timing of the register is invalid. */</i>
<code>GLCDC_ERR_INVALID_GAMMA_SETTING</code>	<i>/* Gamma correction setting is invalid. */</i>

### Properties

Prototyped in file "r\_glcdc\_rx\_if.h"

### Description

This function changes settings for brightness, contrast, and gamma correction of the GLCDC. The setting to be changed is determined according to the first parameter of this function.

This function can be executed when the mode is 'GLCDC\_STATE\_DISPLAYING'. The mode remains unchanged after processing for this command is complete.

### Reentrant

No.

**Example**

```
/* Changes settings for all items */
volatile glcdc_err_t ret_glcde;
glcdc_correction_t correction_cfg;

correction_cfg.brightness.enable = true;
correction_cfg.brightness.r = 0x200;
correction_cfg.brightness.g = 0x200;
correction_cfg.brightness.b = 0x200;

correction_cfg.contrast.enable = true;
correction_cfg.contrast.r = 0x80;
correction_cfg.contrast.g = 0x80;
correction_cfg.contrast.b = 0x80;

correction_cfg.gamma.enable = true;
correction_cfg.gamma.p_r = (gamma_correction_t *)&g_gamma_table;
correction_cfg.gamma.p_g = (gamma_correction_t *)&g_gamma_table;
correction_cfg.gamma.p_b = (gamma_correction_t *)&g_gamma_table;

ret_glcde = R_GLCDC_ColorCorrection(GLCDC_CORRECTION_CMD_SET_ALL,
                                   (void *)&correction_cfg);
if (GLCDC_SUCCESS != ret_glcde)
{

}
```

**Special Notes:**

None.

**R\_GLCDC\_ClutUpdate ()**

This function updates the CLUT memory of the GLCDC.

**Format**

```
glcdc_err_t R_GLCDC_ClutUpdate (
    glcdc_frame_layer_t frame          /* Graphics screen to change operation */
    glcdc_clut_cfg_t const * const p_clut_cfg /* Pointer to the CLUT memory */
                                           /* structure */
)
```

**Parameters**

*glcdc\_frame\_layer\_t*     *frame*  
Graphics screen to change operation

*glcdc\_clut\_cfg\_t*             *p\_clut\_cfg*  
Pointer to the CLUT memory structure

The following lists the *glcdc\_clut\_cfg\_t* structure members and setting values to be referenced. When this function is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

**Table 3.12 glcdc\_clut\_cfg\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
enable	Enable/disable setting of CLUT memory	true	Update CLUT memory.
		false	Not update CLUT memory, if this function is executed.
p_base	Pointer to the start address of the CLUT memory	Other than NULL	Reads the value at the address designated by the pointer and copies it to the CLUT memory.
start	Start entry number of the CLUT memory to be updated	0 to 255 (start + size < 257)	Starts updating the CLUT memory from the entry number specified.
size	Entry size of the CLUT memory to be updated	1 to 256 (start + size < 257)	Updates the CLUT memory for the specified size.

**Return Values**

<i>GLCDC_SUCCESS</i>	<i>/* Processing has been completed successfully. */</i>
<i>GLCDC_ERR_INVALID_PTR</i>	<i>/* The p_clut_cfg parameter is NULL pointer. */</i>
<i>GLCDC_ERR_INVALID_ARG</i>	<i>/* The argument set is invalid. */</i>
<i>GLCDC_ERR_INVALID_MODE</i>	<i>/* Function cannot be executed in this mode. */</i>
<i>GLCDC_ERR_NOT_OPEN</i>	<i>/* R_GLCDC_Open has not been executed. */</i>
<i>GLCDC_ERR_INVALID_UPDATE_TIMING</i>	<i>/* Update timing of the register is invalid. */</i>
<i>GLCDC_ERR_INVALID_CLUT_ACCESS</i>	<i>/* CLUT memory setting is invalid. */</i>

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

This function updates the CLUT memory of the GLCDC.

This function can be executed when the mode is 'GLCDC\_STATE\_DISPLAYING'. The mode remains unchanged after processing in this function is complete.

**Reentrant**

No.

**Example**

```
/* Updates all the CLUT memory for graphics 1 */
volatile glcdc_err_t ret_glcde;
glcdc_clut_cfg_t clut_cfg;

clut_cfg.enable = true;
clut_cfg.p_base = (uint32_t *)g_gr_clut_table;
clut_cfg.size = 256;
clut_cfg.start = 0;

ret_glcde = R_GLCDC_ClutUpdate(GLCDC_FRAME_LAYER_1, &clut_cfg);
if (GLCDC_SUCCESS != ret_glcde)
{
    /* error processing */
}
```

**Special Notes:**

None.

**R\_GLCDC\_GetStatus ()**

This function obtains the GLCDC status.

**Format**

```
glcdc_err_t R_GLCDC_GetStatus (
    glcdc_status_t * const p_status /* Pointer to the structure which */
                                   /* stores the obtained status. */
)
```

**Parameters**

*glcdc\_status\_t \* const p\_status*

Pointer to the structure which stores the obtained status.

**Table 3.13 glcdc\_status\_t Structure Members and Setting Values**

Structure Member	Outline	Setting Value	Description
state	Transition status of the GLCDC FIT module	GLCDC_STATE_NOT_DISPLAYING	GLCDC stopped.
		GLCDC_STATE_DISPLAYING	GLCDC operating.
state_vpos	Detection status of graphics 2 specified line notification	GLCDC_NOT_DETECTED	Not detected.
		GLCDC_DETECTED	Detected.
state_gr1uf	Detection status of graphics 1 underflow	GLCDC_NOT_DETECTED	Not detected.
		GLCDC_DETECTED	Detected.
state_gr2uf	Detection status of graphics 2 underflow	GLCDC_NOT_DETECTED	Not detected.
		GLCDC_DETECTED	Detected.
fade_status	Fading status of graphics 1 and 2	GLCDC_FADE_STATUS_NOT_UNDERWAY	Fade-in/fade-out being stopped.
		GLCDC_FADE_STATUS_FADING_UNDERWAY	Fade-in/fade-out being executed.
		GLCDC_FADE_STATUS_UNCERTAIN	Register value being specified for the graphics.

**Return Values**

*GLCDC\_SUCCESS*

*GLCDC\_ERR\_INVALID\_PTR*

*GLCDC\_ERR\_NOT\_OPEN*

*/\* Processing has been completed successfully. \*/*

*/\* The p\_status parameter is NULL pointer. \*/*

*/\* R\_GLCDC\_Open has not been executed. \*/*

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

This function obtains the GLCDC status. The obtained status is written to the p\_status structure passed with the argument.

This function can be called at any time after the R\_GLCDC\_Open function is executed. The mode remains unchanged after processing in this function is complete.

Reentrant

No.

**Example**

```
/* Obtains the GLCDC status */
volatile glcdc_err_t ret_glcde;
glcdc_status_t status;

ret_glcde = R_GLCDC_GetStatus(&status);
if (GLCDC_SUCCESS != ret_glcde)
{
    /* error processing */
}
```

**Special Notes:**

None.

---

**R\_GLCDC\_GetVersion ()**

---

This function returns the current version of this API.

**Format**

```
uint32_t R_GLCDC_GetVersion (void)
```

**Parameters**

None.

**Return Values**

Version of this API.

**Properties**

Prototyped in file "r\_glcdc\_rx\_if.h"

**Description**

This function will return the version of the currently running API. The version number is encoded where the top 2 bytes are the major version number and the bottom 2 bytes are the minor version number. For example, Version 4.25 would be returned as 0x00040019.

**Reentrant**

Yes.

**Example**

```
/* Gets the GLCDC FIT module version. */  
volatile uint32_t version;  
  
version = R_GLCDC_GetVersion();
```

**Special Notes:**

None.

#### 4. Pin Setting

To use the GLCDC FIT module, assign input/output signals of the peripheral function to pins with the multi-function pin controller (MPC). The pin assignment is referred to as the “Pin Setting” in this document. Please perform the pin setting after calling the R\_GLCDC\_Open function.

When performing the Pin Setting in the e<sup>2</sup> studio, the Pin Setting feature of the FIT configurator or the Smart Configurator can be used. When using the Pin Setting feature, a source file is generated according to the option selected in the Pin Setting window in the FIT configurator or the Smart Configurator. Pins are configured by calling the function defined in the source file. Refer to Table 4.1 for details.

**Table 4.1 Function Output by the FIT Configurator**

MCU used	Function generated	Remarks
RX65N RX72M	R_GLCDC_PinSet()	

## 5. Using the GLCDC FIT Module

### 5.1 Screen Definition

In the GLCDC FIT module, reference points, the active display area, and the display start position for each screen are determined based on the parameter values of functions R\_GLCDC\_Open and R\_GLCDC\_LayerChange. Specify the arguments referencing Figure 5.1 Screen Definition and Table 5.1 Arguments and Available Setting Values.

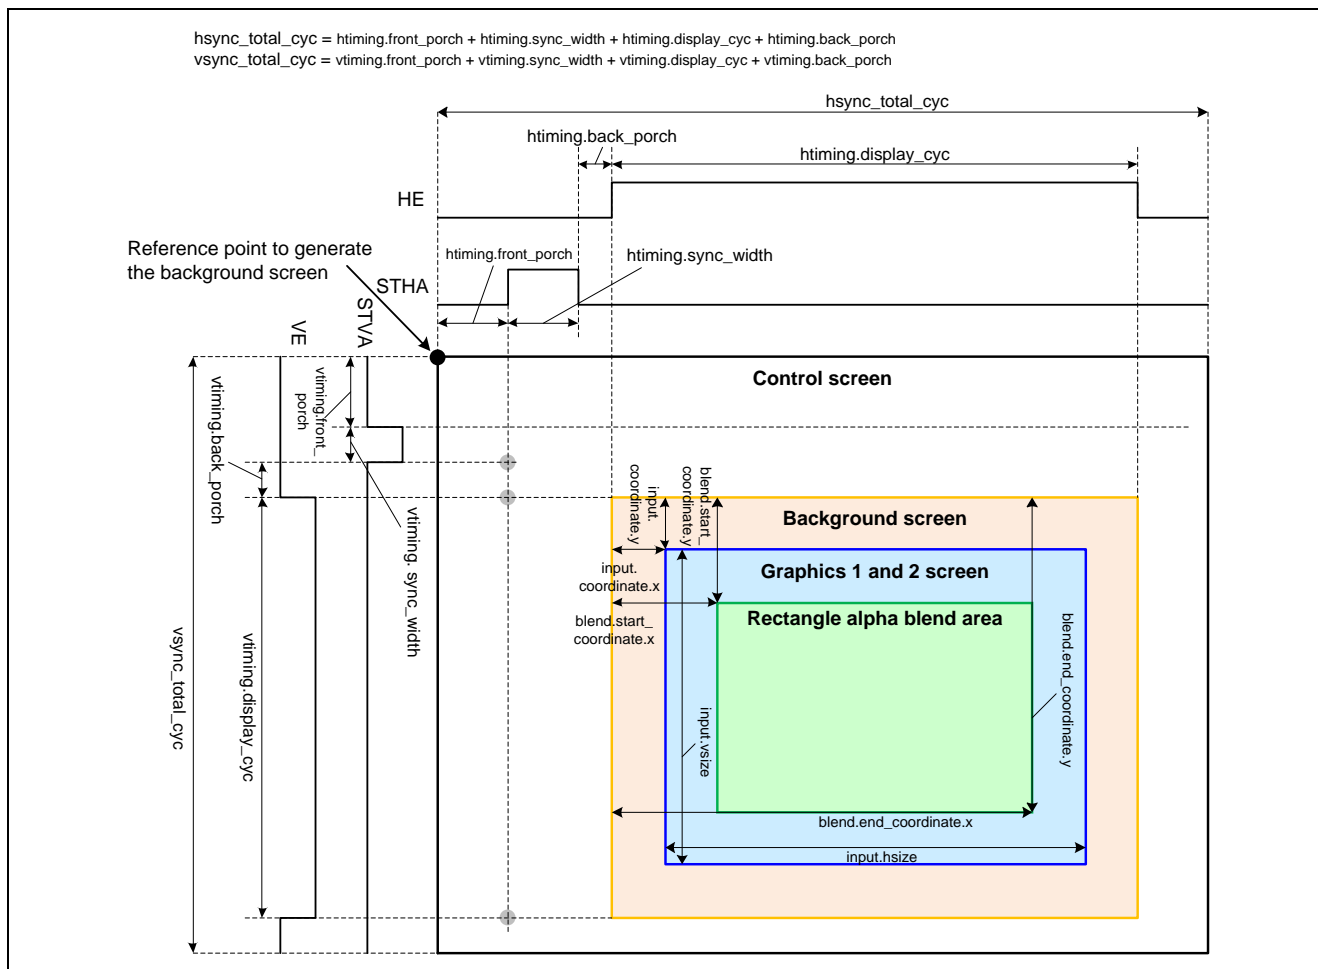

Figure 5.1 Screen Definition

Table 5.1 Arguments and Available Setting Values

Argument Name	Setting Value	Remarks
htiming.front_porch	$2 < \text{htiming.front\_porch} < 18$	Specify a value in the range $23 < \text{hsync\_total\_cyc} < 1025$ where $\text{hsync\_total\_cyc} = (\text{htiming.front\_porch} + \text{htiming.back\_porch} + \text{htiming.display\_cyc} + \text{htiming.sync\_width})$ .  Specify a value in the range $5 < ((\text{htiming.front\_porch} - 2) + \text{htiming.back\_porch} + \text{htiming.sync\_width})$ .  When using dithering with 2x2 pattern, specify htiming.display_cyc to a multiple of 4.
htiming.back_porch	$0 < \text{htiming.back\_porch}$	
htiming.display_cyc	$15 < \text{htiming.display\_cyc}$	
htiming.sync_width	$0 \leq \text{htiming.sync\_width}$	
vtiming.front_porch	$1 < \text{vtiming.front\_porch} < 17$	Specify a value in the range $19 < \text{vsync\_total\_cyc} < 1025$ where $\text{vsync\_total\_cyc} = (\text{vtiming.front\_porch} + \text{vtiming.back\_porch} + \text{vtiming.display\_cyc} + \text{vtiming\_syncwidth})$ .  Specify a value in the range $2 < ((\text{vtiming.front\_porch} - 1) + \text{vtiming.back\_porch} + \text{vtiming.sync\_width})$ .  When using dithering with 2x2 pattern, specify vtiming.display_cyc to a multiple of 2.
vtiming.back_porch	$0 < \text{vtiming.back\_porch}$	
vtiming.display_cyc	$15 < \text{vtiming.display\_cyc}$	
vtiming.sync_width	$0 \leq \text{vtiming.sync\_width}$	
input.hsize	$15 < \text{input.hsize} < (\text{htiming.display\_cyc} + 1)$	Specify an even value.
input.coordinate.x	$0 \leq \text{input.coordinate.x} < (\text{htiming.display\_cyc} - 15)$	Specify a value in the range $(\text{input.coordinate.x} + \text{input.hsize}) < (\text{htiming.display\_cyc} + 1)$ .
input.vsize	$15 < \text{input.vsize} < (\text{vtiming.display\_cyc} + 1)$	
input.coordinate.y	$0 \leq \text{input.coordinate.y} < (\text{vtiming.display\_cyc} - 15)$	Specify a value in the range $(\text{input.coordinate.y} + \text{input.vsize}) < (\text{vtiming.display\_cyc} + 1)$ .
blend.start_coordinate.x	$0 \leq \text{blend.start\_coordinate.x} < \text{blend.end\_coordinate.x} < \text{htiming.display\_cyc}$ and $0 \leq \text{blend.start\_coordinate.x} < \text{blend.end\_coordinate.x} < 1017$	Specify a value in the range $(\text{htiming.back\_porch} + \text{htiming.sync\_width} + \text{blend.start\_coordinate.x}) < 1006$ .  If use horizontal range between 100 and 200, set <i>blend.start_coordinate.x</i> to 100 and <i>blend.end_coordinate.x</i> to $(200 + 1)$ .
blend.end_coordinate.x		
blend.start_coordinate.y	$0 \leq \text{blend.start\_coordinate.y} < \text{blend.end\_coordinate.y} < \text{vtiming.display\_cyc}$ and $0 \leq \text{blend.start\_coordinate.y} < \text{blend.end\_coordinate.y} < 1021$	Specify a value in the range $(\text{vtiming.back\_porch} + \text{vtiming.sync\_width} + \text{blend.start\_coordinate.y}) < 1007$ .  If use vertical range between 100 and 200, set <i>blend.start_coordinate.y</i> to 100 and <i>blend.end_coordinate.y</i> to $(200 + 1)$ .
blend.end_coordinate.y		

## 5.2 Calculating Gamma Correction Value

This section describes how to calculate a gamma correction value in the GLCDC FIT module.

By using the gamma correction feature in the GLCDC FIT module, brightness of the LCD panel can be adjusted based on the characteristic of the panel used. To perform gamma correction properly, specify a gain value to the GAMxLUTn register (n=1 to 8) and a threshold value of the area to the GAMxAREAn register (n = 1 to 5).

An example below describes calculation of the gain value for each area.

$$Dout = \left( \frac{Din}{pixel} \right)^{\frac{1}{\gamma}} \times pixel$$

In the above calculation formula,  $\gamma$  is gamma, *pixel* is the number of pixels, *Din* is a brightness value before correction, and *Dout* is a brightness value after correction. Note that the GLCDC calculates I/O signal with 10 bits. Thus *pixel* becomes 1023.

For example, if the width is set to 64 for each area and the gamma value  $\gamma$  is 0.7, then, when *Din* is 0 *Dout* becomes 0, and when *Din* is 64 *Dout* becomes 19.512.

$$gain = \frac{Dout_{m+1} - Dout_m}{width} \quad (m = 0 \text{ to } 15)$$

In the above calculation formula, *Dout*(*m*+1) is a brightness value after correction for area 1, *Dout*(*m*) is a brightness value after correction for area 0, and *width* is the width of the area 0 when calculating the gain value of the area 0.

The gain value for area 0 becomes 0.304875 with the formula above. The gain value set to the register for area 0 becomes "0.304875 × 1024 = 312 (rounding off one decimal place)". Repeat the procedure above for 16 areas and configure the gamma correction table.

Set the threshold for setting the width of each area to be  $TH(k) < TH(k+1)$ . However, only in case of  $TH(k) = 0x3FF$ , it can be  $TH(k) = TH(k+1)$ .

An example below shows configuring the gamma correction table with each gamma correction value.

```
/* Gamma correction table when the gamma correction value is 0.5 */
const gamma_correction_t g_gamma_table =
{
    /* gain (r = 0.5) */
    { 64, 192, 320, 448, 577, 705, 833, 961, 1089, 1217, 1345, 1473, 1602,
      1730, 1858, 1954 },
    /* threshold */
    { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};

/* Gamma correction table when the gamma correction value is 0.7 */
const gamma_correction_t g_gamma_table =
{
    /* gain (r = 0.7) */
    { 312, 528, 659, 762, 849, 926, 995, 1057, 1116, 1170, 1222, 1270, 1316, 1361,
      1403, 1421 },
    /* threshold */
    { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};

/* Gamma correction table when the gamma correction value is 0.9 */
const gamma_correction_t g_gamma_table =
{
    /* gain (r = 0.9) */
    { 753, 873, 925, 961, 988, 1010, 1029, 1046, 1061, 1074, 1086, 1097, 1107,
      1117, 1126, 1116 },
    /* threshold */
    { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};

/* Gamma correction table when the gamma correction value is 1.1 */
const gamma_correction_t g_gamma_table =
{
    /* gain (r = 1.1) */
    { 1317, 1157, 1103, 1069, 1045, 1026, 1010, 997, 986, 976, 967, 959, 952, 945,
      939, 919 },
    /* threshold */
    { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};

/* Gamma correction table when the gamma correction value is 1.3 */
const gamma_correction_t g_gamma_table =
{
    /* gain (r = 1.3) */
    { 1941, 1367, 1211, 1119, 1056, 1008, 970, 938, 911, 888, 868, 850, 834, 819,
      806, 781 },
    /* threshold */
    { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};
```

### 5.3 Notes on Blending Setting

In the Show/hide setting of the image, Control setting for blending, Enable/disable setting of chroma keying, there are limitation to the combination of the setting values. The combination of setting values shows Table 5.2 Combination of Setting Values. Don't use other than combination of setting values described.

**Table 5.2 Combination of Setting Values**

Show/hide setting of the graphics (blend.visible)	Control setting for blending (blend.blend_control)	Enable/disable setting of chroma keying (chromakey.enable)	Display contents
false	GLCDC_BLEND_CONTROL_NONE	false	Lower-layer graphics
false	GLCDC_BLEND_CONTROL_PIXEL	false	Lower-layer graphics
true	GLCDC_BLEND_CONTROL_NONE	false	Current graphics
true	GLCDC_BLEND_CONTROL_FADEIN	true	Within rectangular area, Fade-in of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Within rectangular area, Fade-in of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of current graphics and lower-layer graphics
true	GLCDC_BLEND_CONTROL_FADEOUT	true	Within rectangular area, Fade-out of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Within rectangular area, Fade-out of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of current graphics and lower-layer graphics
true	GLCDC_BLEND_CONTROL_FIXED *1	true	Within rectangular area, Rectangular alpha blending of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Within rectangular area, Rectangular alpha blending of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of current graphics and lower-layer graphics

true	GLCDC_BLEND_ CONTROL_PIXEL	true	Per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Per-pixel alpha blending of current graphics and lower-layer graphics

Notes: 1. If this value is set on the graphics screen, the obtained status "fade\_status" when executing R\_GLCDC\_GetStatus function is always "GLCDC\_FADE\_STATUS\_FADING\_UNDERWAY".

## 5.4 Notes on Priority Order Setting of Internal Main Bus 2

For internal main bus 2 used by GLCDC, there is a priority order setting. After a reset is released, the order is graphic 1 > graphic 2, thus the data of graphic 1 is read first. The priority order can be set using the board support package module (BSP module). Refer to the Board Support Package Module Using Firmware Integration Technology (R01AN1685), "3.2.10 Expansion Bus Master Priority Setting" for details.

## 5.5 When Macro Line Offset Restrictions Cannot Be Followed

If it is not possible to observe macro line offset restrictions due to the data format or the horizontal width of the frame buffer, create an image that satisfies the macro line offset restrictions by expanding the horizontal width of the image to create a margin.

For example, the following explains how to display an image of the CLUT(8) data format and a horizontal width of 480 px of the frame buffer on the LCD. Usually, macro line offset should be set to 480 (the number of bytes per pixel x horizontal width of the image = 1 x 480). However, 480 is not a multiple of 64, which is the macro line offset restriction. Therefore, expand the image to a horizontal width of 512 pixels including margin so that the condition is satisfied, and write the expanded image to the frame buffer. After that, by setting the horizontal width (input.hsize) of the image data to 480 pixels, it is possible to display the image at any horizontal width. There will be redundancy in the frame buffer by expansion, and memory usage for that will increase.

For details, refer to the chapter on the Graphic LCD Controller (GLCDC) in the User's Manual: Hardware of each device.

Figure 5.1 below shows an image processing example. The red line in the expanded image indicates the expanded portion.

Figure 5.1 Expanded Image Sample

## 6.2 Troubleshooting

(1) Q: I have added the FIT module to the project and built it. Then I got the error: Could not open source file "platform.h".

A: The FIT module may not be added to the project properly. Check if the method for adding FIT modules is correct with the following documents:

- Using CS+:

Application note "Adding Firmware Integration Technology Modules to CS+ Projects (R01AN1826)"

- Using e<sup>2</sup> studio:

Application note "Adding Firmware Integration Technology Modules to Projects (R01AN1723)"

When using a FIT module, the board support package FIT module (BSP module) must also be added to the project. For this, refer to the application note "Board Support Package Module Using Firmware Integration Technology (R01AN1685)".

(2) Q: I have added the FIT module to the project and built it. Then I got the error: This MCU is not supported by the current r\_glcdc\_rx module.

A: The FIT module you added may not support the target device chosen in your project. Check the supported devices of added FIT modules.

(3) Q: I have added the FIT module to the project and built it. Then I got an error for when the configuration setting is wrong.

A: The setting in the file "r\_glcdc\_rx\_config.h" may be wrong. Check the file "r\_glcdc\_rx\_config.h". If there is a wrong setting, set the correct value for that. Refer to 2.7 Configuration Overview.

(4) Q: I have to set three signals in this FIT module, Vsync, Hsync and DE. Does the module support Vsync and Hsync only, or DE only LCD?

A: By performing pin setting (MPC setting) of signals to be used, it is possible to support each LCD module.

Signals for which the pin has not been set will not be output. All signals must be allocated even though they are not used.

(5) Q: There is a line detection (VPOS interrupt) function. Let me know the line detection occurrence timing.

A: Refer to 5.1 Screen Definition.

Detection occurs when the STHA signal is asserted at the last line of the entire control screen shown in Figure 5.1 Screen Definition.

(6) Q: Images cannot be displayed as I expect.

Q-1: Image data are not displayed on LCD panel.

A-1: The pin setting may not be performed correctly. When using this FIT module, the pin setting must be performed. Refer to 4 Pin Setting for details.

Q-2: When I change the image data format (32bpp, 16bpp, 8bpp, etc.), images cannot be displayed as I expect.

A-2: Check the following parameters.

1. Data format of the frame buffer (input.format)

Specify the data format appropriate for the image data.

2. Image horizontal width (input.hsize)

3. Macro line offset (input.offset)

Set the macro line offset (number of bytes per pixel x horizontal width) to a multiple of 64. If it is not possible to observe this restriction, refer to 5.5 When Macro Line Offset Restrictions Cannot Be Followed.

Q-3: When I set RX MCU to big endian, images cannot be displayed as I expect.

A-3: Perform endian conversion of the image data. The method of endian conversion differs depending on the data format. For details, refer to the chapter on the Graphic LCD Controller (GLCDC) in the User's Manual: Hardware of each device.

Q-4: Image color tones are not normal.

A-4: Check that the pixel order of the frame buffer is ARGB (alpha value, red value, green value, blue value). Also, check the pixel order (output.color\_order) of the output data.

## Revision Record

Rev.	Date	Description	
		Page	Summary
1.00	Oct.01.2017	—	First edition issued
1.01	Feb.01.2019	52	Added Table 6.2 Operation Confirmation Environment (Rev. 1.01)
		—	Changes associated with functions: Added support setting function of configuration option Using GUI on Smart Configurator. [Description] Added a setting file to support configuration option setting function by GUI.
1.10	May.31.2019	—	Added support for GCC and IAR compilers.
		1	Added the target compiler.
		7	Changed the code size format.
		19	Added section 2.13 “for”, “while” and “do while” statements
		30	Added “Notes on macro line offset setting” to Special Notes.
		60	Added section 5.4 “Notes on Priority Order Setting of Internal Main Bus 2” and section 5.5 “When Macro Line Offset Restrictions Cannot Be Followed”
		62	Added Table 6.2 Operation Confirmation Environment (Rev. 1.10).
		63-64	Added (4) to (6) in section 6.3 Troubleshooting
1.20	May.31.2019	—	Added support for RX72M.

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

## 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

## 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

## 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

## 4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

## 5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

## 6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.).

## 7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

## 8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
